

Managed Firewall

As the Internet has evolved into a medium of choice for most companies to communicate, the security risks have grown accordingly. Most organizations now provide network access via the Internet to mobile employees, partners, suppliers and customers; this creates security loopholes for others with ill intent to leverage. Firewalls establish strong perimeter security; however, it also becomes the focal point of attack. For a company to effectively secure critical information, it takes more than adding the latest security hardware and software. For a firewall to be effective, it must be configured, managed and updated on a regular basis. This is where Internap can help.

Key elements in keeping up with a wide variety of evermore complex network security threats is developing a comprehensive security plan, which includes the Internap® Managed Firewall service at the core with the following:

Our Security Experts become an extension of your in-house IT staff, providing best practices in security policy and configuration to allow the maximum level of security for your network.

Managed Service – our security experts will keep your security appliance up-to-date with firmware and security patches as new vulnerabilities are discovered.

Hardware Firewall Appliance – FortiGate from Fortinet offers the highest level of security at a very attractive price performance ratio, which is included with the Internap Managed Firewall service.

Flexibility – Internap Managed Firewall service can fit any network topology with little or no network changes. This service can support many modes of operation, including transparent, route and Network Address Translation (NAT). In addition, the firewall works with any ISP supporting static addressing, dynamic addressing and PPPoE.

Reporting – The customer portal provides your in-house IT staff with access to real-time firewall information, logs which include in and out access, as well as system event information in easy-to-understand templates for regulatory compliance or management review.

Built-In DHCP Server allows the firewall to assign the network-addressing information to local area network computers.

Virtual Private Network (VPN) – Built-in robust VPN functionality allows for site-to-site secure access from branch office and remote sites.

Upgradable Options – SSL VPN, Gateway Anti-Virus, Anti-Spam, Content Filtering, Intrusion Prevention System and High Availability

Features

- Fully managed solution (24x7x365 protection and support)
- Implementation and configuration
- Security policy configuration
- Off-site back-up configuration storage
- Built-in site-to-site VPN capabilities
- Firmware and security patch updates
- Policy changes within 24 hours
- Industry-leading Fortinet FortiGate appliance included
- Hardware replacement within 24 hours

Benefits

- Cost effective – no need to hire security experts or train internal IT staff
- Reduces likelihood of business interruption due to compromised security
- Reporting – portal offers templates to generate user-friendly reports, as well as detailed reports for regulatory compliance
- Fits any network topology with little or no network changes
