

Optimal Availability, Maximum Performance

Applications deployed over IP networks are a serious investment for companies that rely on the Internet for operational and financial performance. Many companies “multi-home” their network architecture in order to eliminate the carrier network as a single point of failure. However, visibility into network performance, availability and cost considerations are not attainable. Without the ability to measure or intelligently manage the network, performance can unexpectedly suffer with no way to identify the cause. Companies need a way to measure and manage network performance to ensure their applications perform optimally and are available at all times.

The Internap Solution

The Internap Flow Control Platform (FCP), an intelligent route optimization appliance, takes your multi-homed environment to the next level by continually monitoring your network for latency, packet loss, route stability and congestion. Our solution automatically reroutes traffic to guarantee performance levels for your critical applications. The result – easier troubleshooting, improved network performance and intelligent traffic management across multiple provider links.

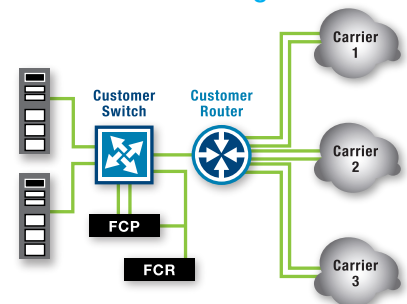

FCP can help identify why your Internet-based applications aren't performing to users' expectations and help route around outages and network issues that can cripple your business or damage your brand. FCP goes beyond mere traffic analysis by delivering meaningful metrics and reports you can use to understand your network's current state and implement real-time changes based on that knowledge.

FCP Benefits

- Significantly improve the performance and availability of your multi-homed network architecture.
- Dynamically measure your applications' end-to-end performance over the Internet.
- Efficiently generate reports on network performance and cost.
- Expertly perform forensic analysis when problems occur and manage your service providers to their SLAs.
- Automatically route traffic around major network outages or based on cost savings for key applications.
- Progressively manage IP network issues such as outages, black holes, brownouts and slowdowns that can ultimately impact revenue and productivity.
- Proactively identify and choose the best-performing path for your traffic at all times.
- Ultimately improve customer satisfaction.

FCP Network Configuration

Flow Control Platform

The Internap Difference

FCP offers unparalleled visibility into your multi-homed network architecture with extensive analysis, management and reporting functions. FCP then acts on that analysis to automatically route data traffic to avoid network issues. No longer will the daily, and even hourly, variations in provider performance or availability stall your business-critical applications.

FCP's unparalleled measurement capability gives you better performance, fewer network incidents, sophisticated traffic management and easier troubleshooting. These features enable you to successfully deploy applications such as streaming/content delivery, e-commerce, CRM, hosting, and trading/clearing.

Product Features

FCP uses real traffic to measure round-trip performance and then balances a combination of competing cost and performance metrics to determine optimal routes. Rather than forcing you to make network traffic management decisions on-the-fly, FCP gives you the tools you need to manage network connections more effectively allowing you to:

- Fully utilize network infrastructure
- Simultaneously optimize for cost and performance
- Ensure you and your carrier are in SLA compliance

Greater Visibility and Troubleshooting Control

Our FCP solution pinpoints problems in minutes rather than in hours or days, enabling you to:

- Perform forensic analysis when issues occur
- Determine the cause of network, user and application issues
- Reduce help desk calls and quickly resolve issues

Manage Your Providers, Allocate Costs

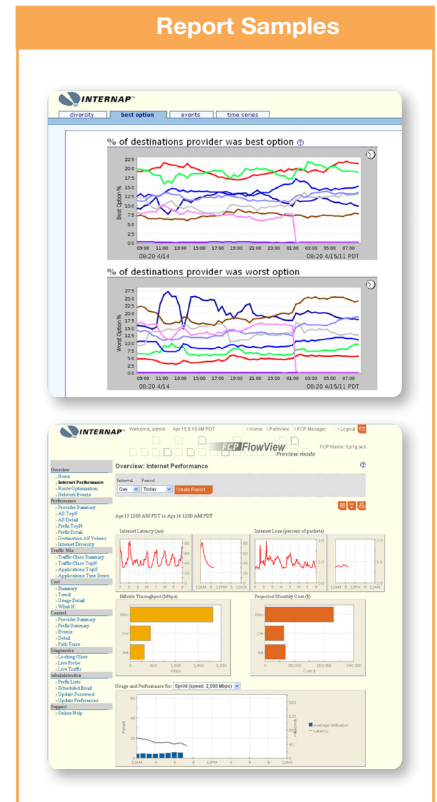

FCP gives you concrete performance data to restructure and enforce SLAs. In addition, a rich set of reports allows you to intelligently manage your network and communicate network performance and utilization across stakeholders. As a result, you can:

- Allocate costs across your organization based on application and bandwidth use
- Provide internal SLAs
- Highlight performance reports about your most critical applications

Powerful Performance and Usage/Cost Reporting

An extensive set of network and executive management reports includes:

- Web-based, email and live reporting, offers real-time traffic analysis using granular filtering
- Flexible reporting with customizable time intervals, detail levels, viewing/data export options and your choice of performance metric and destination networks
- Trend analyzer indicating monthly costs and billable throughput
- Real-time flow statistics (host or prefix-specific bit-rate, total bitrate, packets per second, dropped packets, protocol accounting and sessions)
- Internet performance reports showing overall current and historical network performance, monthly projected usage costs and frequently used autonomous systems (AS)

Why Internap?

Transform your IT Infrastructure into a competitive advantage with IT IQ from Internap, intelligent IT Infrastructure solutions that deliver unparalleled performance, availability and support.

Since 1996, thousands of enterprises have entrusted Internap to deliver their online applications across our platform of connectivity, colocation, managed hosting and cloud services.
