

managed hosting

For Linux

Internap Managed Hosting Services for Linux Servers deliver 24/7 monitoring, maintenance and management by experienced and certified Linux Administrators. Enterprise services help administrators maintain Linux server performance and reliability while adding on-going compliance reporting.

Accountability and Compliance

Internap Managed Hosting Services include a Virtual Private Management Gateway (VPMG) which restricts access to servers by role, time-based or by trouble ticket. Administrators performing operations/changes on a Linux server will only see what is required for them to remediate the issue(s). All login sessions into the VPMG are recorded and attached to the trouble ticket that the problem is associated with. This provides complete accountability and meets compliance requirements for tracking all changes to IT operations.

Enterprise Services for Linux Servers

Gold Care

24/7 monitoring of CPU, disk, memory, services and print queue	✓
Verification of event logs and system state backup	✓
Alert filtering/de-duplication, validation and escalation	✓
